AMENDMENTS TO THE CLAIMS

Please add claims 5-13.

- 1. (Previously Presented) A method for producing a porous film wherein a porous film of a poly(vinylidene fluoride) based resin is prepared by dissolving the poly(vinylidene fluoride) based resin in a poor solvent through heating to form a liquid raw material for a film, and then cooling the liquid raw material at temperature of 170°C or above to bring about a phase separation, characterized in that an organized clay being organized by a hydrophilic compound is dispersed in said liquid raw material for a film in an amount of 1 to 25 parts by weight relative to 100 parts by weight of the poly(vinylidene fluoride) based resin.
- 2. (Original) The method for producing a porous film according to claim 1, wherein the temperature of said liquid raw material for a film before cooling is 170°C or above and lower than the thermal decomposition temperature of the poly(vinylidene fluoride) based resin.
- 3. (Previously Presented) A porous film comprising a poly(vinylidene fluoride) based resin and an organized clay being organized by a hydrophilic compound, the organized clay being dispersed therein in an amount of 1 to 25 parts by weight relative to 100 parts by weight of the poly(vinylidene fluoride) based resin, wherein a microstructure is formed by a thermally induced phase separation method of cooling the liquid raw material at temperature of 170°C or above to bring about a phase separation, said microstructure having an irregularly shaped resin phase continuous in a three-dimensional manner with a network structure and having irregularly shaped pore spaces therebetween.
- 4. (Original) The porous film according to claim 3, wherein said organized clay is a clay prepared by organizing a layered inorganic silicate with an alkylene oxide compound.
- 5. (New) The method for producing a porous film according to claim 1, wherein said organized clay is a clay prepared by organizing a layered inorganic silicate with an alkylene oxide compound.

6. (New) The porous film according to claim 3, wherein the temperature of said liquid raw material for a film before cooling is 170°C or above and lower than the thermal decomposition temperature of the poly(vinylidene fluoride) based resin.

- 7. (New) The method for producing a porous film according to claim 1, wherein said porous film comprises a microstructure having an irregularly shaped resin phase continuous in a three-dimensional manner with a network structure and having irregularly shaped pore spaces therebetween.
- 8. (New) The method for producing a porous film according to claim 1, wherein said organized clay is a clay prepared by organizing a layered inorganic silicate with a hydrophilic compound, wherein said hydrophilic compound is an organic onium ion.
- 9. (New) The method for producing a porous film according to claim 1, wherein said poor solvent comprises a phthalic acid ester.
- 10. (New) The method for producing a porous film according to claim 1, wherein said porous film has an average pore diameter of 0.1 to 8 μ m.
- 11. (New) The porous film according to claim 3, wherein said porous film has an average pore diameter of 0.1 to 8 μm .
- 12. (New) The method for producing a porous film according to claim 1, wherein said porous film has a porosity of 50 to 90%.
- 13. (New) The porous film according to claim 3, wherein said porous film has a porosity of 50 to 90%.
